

PRIN project 2022-2024

**Economic development in Italy
from the Middle Ages to today:
A regional perspective**

Presented by
Jacob Weisdorf

How deep are the roots of regional inequality?

Income per person by municipality today (2017)

PRIN: €680.000 to find answers – why?

PRIN: €680.000 to find answers – why?

Traditional economic historians on going back beyond 1861:

- “We tried but we couldn’t find any answers”
- “This will take several lifetimes to find out”
- “Don’t open that door”
- “We will never know”
- “*No* answers are better than *wrong* answers”

New economic historians (*Cliometricians*):

- “*Wrong* answers are better than *no* answers”

Columbus: “Welcome to ~~India~~ America!”

Columbus: “Welcome to ~~India~~ America!”

Traditional
economic history
mentality:

Columbus shouldn't
have gone!

Columbus: “Welcome to ~~India~~ America!”

Traditional
economic history
mentality:

Columbus shouldn't
have gone!

New
economic history
mentality:

We learned from Columbus
and now we are wiser

PRIN: €680.000 to find answers - what?

Our project turns to history for answers to *four* main questions:

- 1) How deeply rooted is regional income inequality in Italy?
- 2) What factors were important in inter-regional development?
- 3) Who were the regional winners and losers of Italy's unification?
- 4) What lessons can we take from history regarding Italy's future?

The four PRIN project units

PRIN: €680.000 to find answers – how?

We plan to build a new database:

- Hope this can be done in three years (2022-24)
- First-ever historical database worldwide
- Period: 1500 to 2000
- Covering ten regions of Italy
- Main variables: the real wage of unskilled workers
- Growth fundamentals: geography, institutions, culture, and demography

Panel structure:
10 regions

10 time periods

= 100 observations

of each variables

Variables:

- Income data
- Geography
- Demography
- Institutional
- Culture

Examples:

Geography:

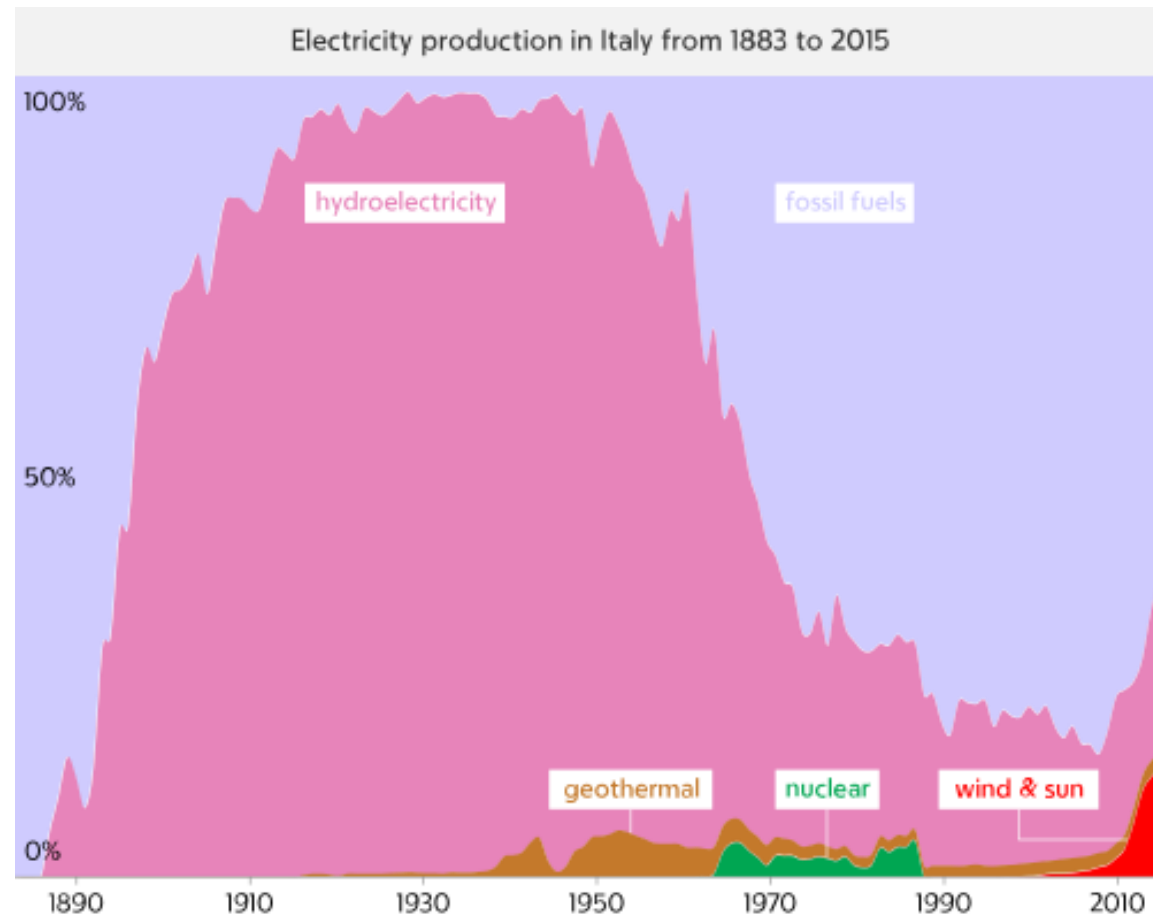

Hydro-electric potential

Example: Hydro-electric power potential

Industrialisation in Italy:

- England's industrialisation started c. 1750
- Steam-powered industry: cheap coal
- Italy had very few coalfields
- Coal expensive to import/transport
- Italy's industrialisation delayed
- Had to await electricity
- Emerged in the 1880s mainly from hydro power

Hydro-power hugely successful

Hypothesis: early hydro-location rich today

Locations with hydro-power plants potentially gained a head start:

- First-mover advantage in industrialisation
- Non-hydro locations were set back relatively
- Setback areas began to catch up only after WW2
- Income gap between hydro and non-hydro areas still visible today

Data: early hydro-location rich today

Municipality-level analysis:

- Explained: income per person in 2017
- Explanatory: hydro plant prior to 1911 (yes/no)
- End before WW1: early start
- Alternative 1: Hydro plant buffer zone (30 km radius)
- Alternative 2: Electric generator (yes/no)
- Control: latitude or longitude

Illustration: Early electricity distribution

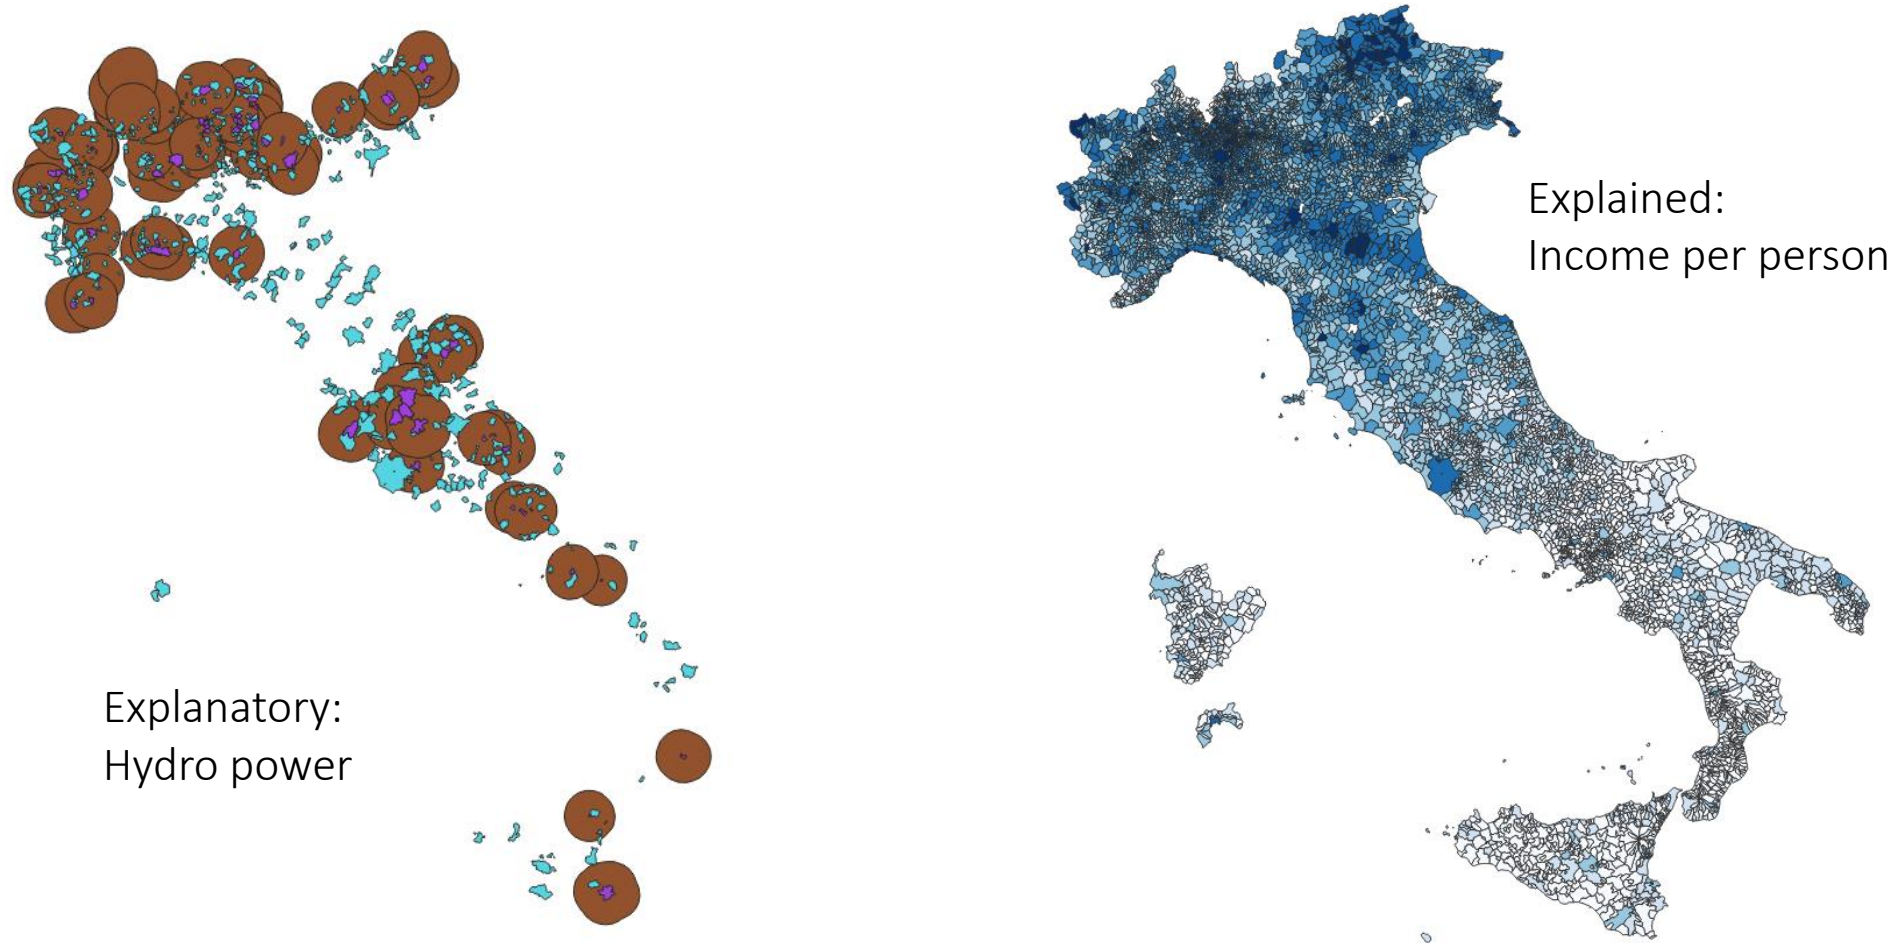

Municipality nearby power plant

Municipality with power plant

Municipality with electric generator

Hydro, nearby (30 km), and generators

Hydro, nearby (30 km), and generators

Are municipalities with hydro richer today?

(2) Standard errors clustered by province

	(1)	(2)	(3)	(4)
	Income 2017	Income 2017	Income 2017	Income 2017
Power plant	0.102*** (0.0213)	0.109*** (0.0292)	0.00610 (0.0245)	0.0349 (0.0264)
Latitude			0.0858*** (0.00432)	
Longitude				-0.0652*** (0.00566)

N	7714	6644	6644	6644

Standard errors in parentheses

† p<0.15, * p<0.10, ** p<0.05, *** p<0.010

No, not when we add longitude or latitude

Municipalities with electric generators richer?

(2) Standard errors clustered by province

	(1)	(2)	(3)	(4)
	Income 2017	Income 2017	Income 2017	Income 2017
Electric generator	0.140*** (0.00848)	0.140*** (0.0214)	0.0463*** (0.0104)	0.0544*** (0.0131)
Latitude			0.0852*** (0.00429)	
Longitude				-0.0645*** (0.00563)
Constant	9.354*** (0.00354)	9.354*** (0.0305)	5.670*** (0.188)	10.12*** (0.0681)
r2	0.0218	0.0218	0.628	0.472
N	6644	6644	6644	6644

Standard errors in parentheses

† p<0.15, * p<0.10, ** p<0.05, *** p<0.010

Yes, even when we add longitude or latitude:
Municipalities with generators are 5% richer today on average

Thank you for your attention!

Income per person by municipality today (2017)

Thank you!

Hypothesis: lost opportunity?

- 1) Can we predict hydro-power potential?
- 2) If yes, can we then compute income loss of not building a plant?

How to proceed:

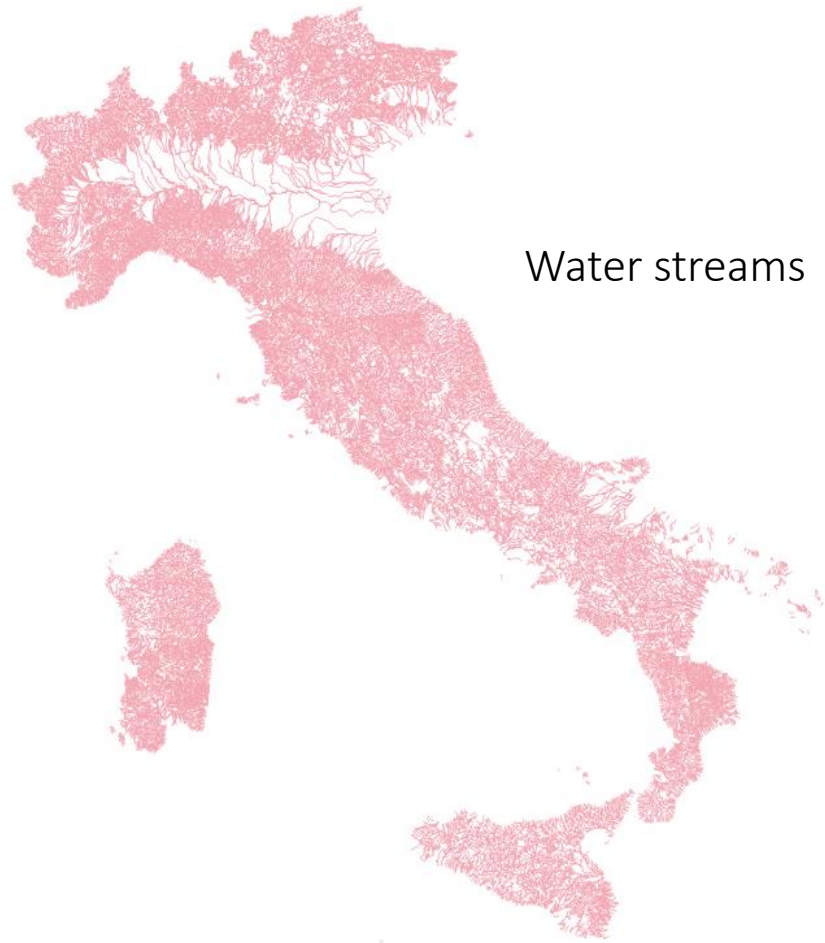

- a) Identify municipalities with water streams
- b) Identify municipalities with power potential (slope)
- c) Identify municipalities with rainfall potential

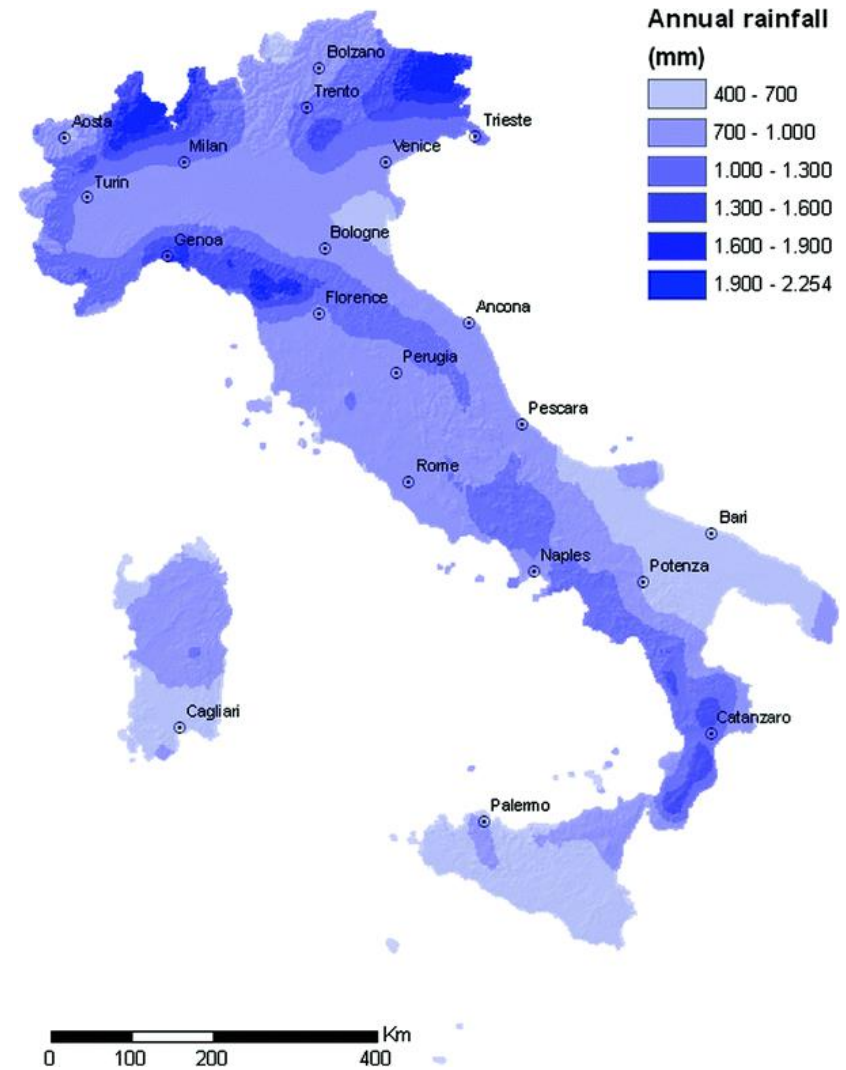

Water streams

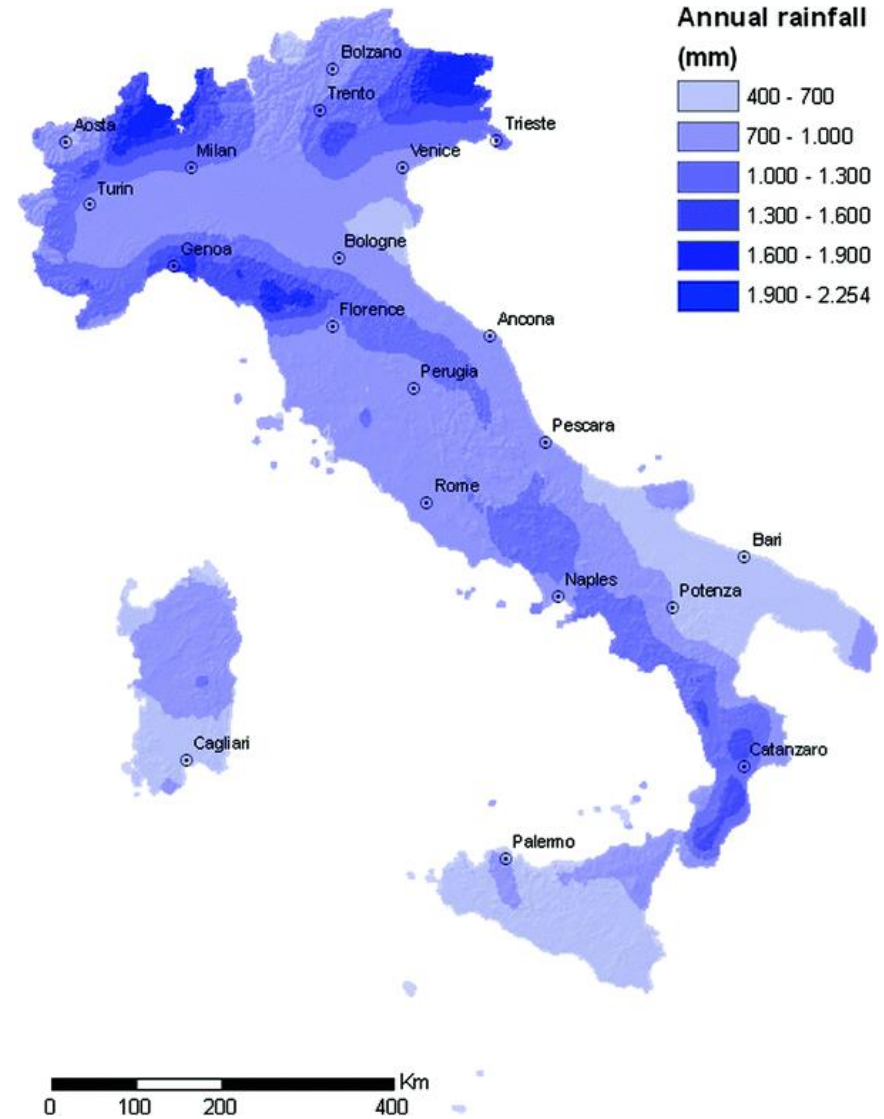

Income per person

Water streams

Hydro-power possibility

Hydro-power possibility

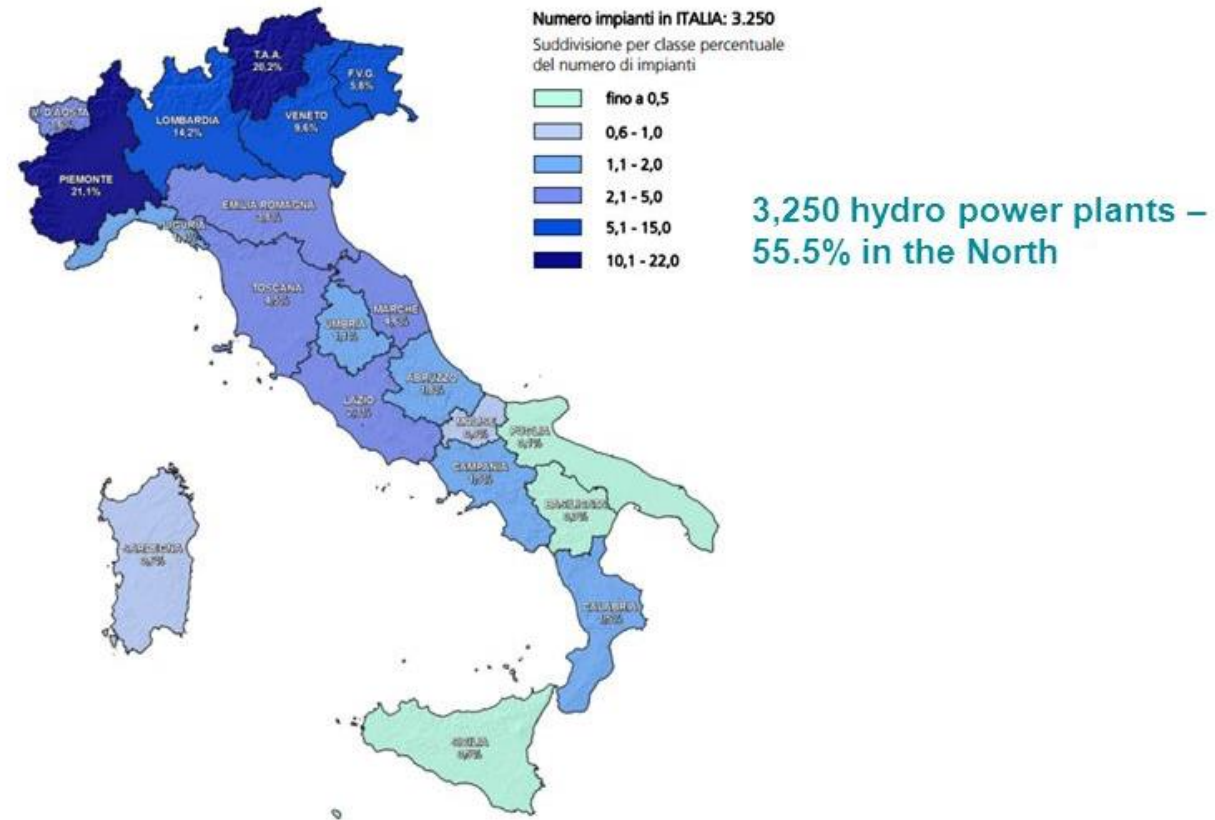

In each municipality:

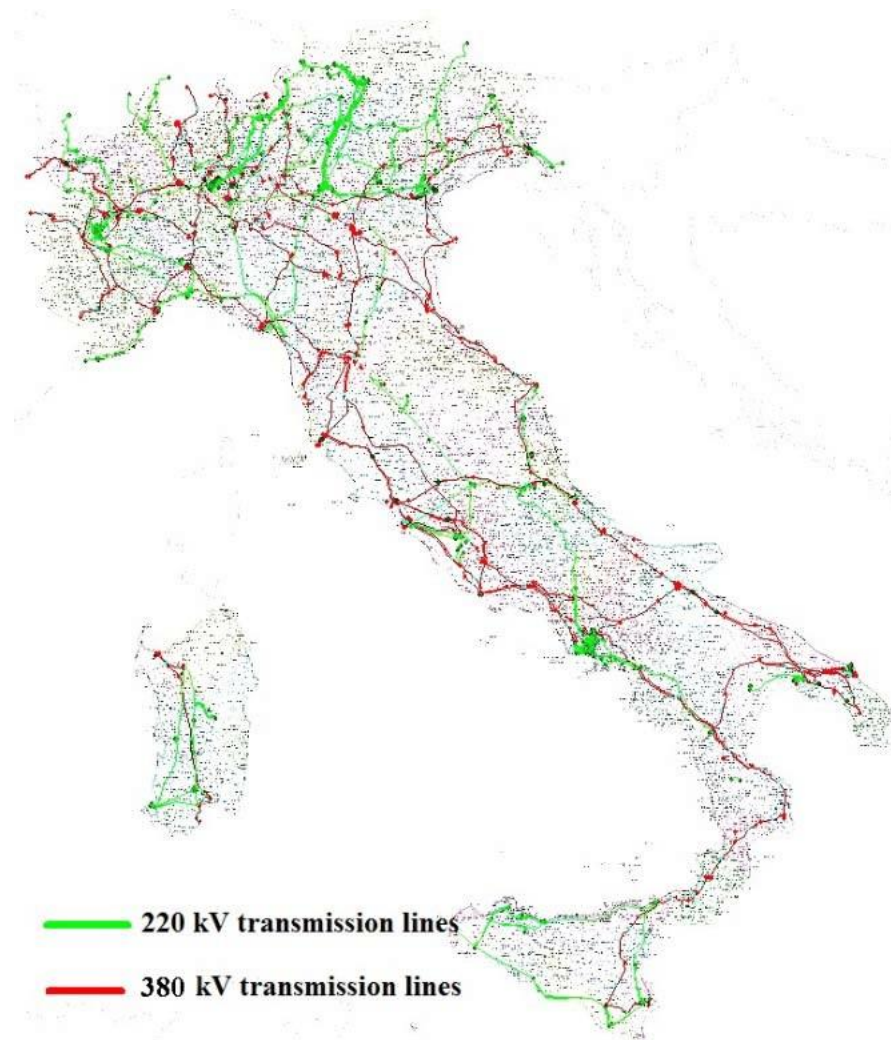

- 1) Compute maximum height difference in municipality (**A**)
- 2) Compute distance between the two points (**B**)
- 3) Calculate slope $C = A/B$
- 4) If several water streams, use max slope (first-best)

2) What factors were relevant?

Regional distribution of the number of hydro power plants at the end of 2013

2) What factors were relevant?

Water

Shafts

Steam

Electricity
